

# CP Violation and Hot Topics From BABAR Experiment

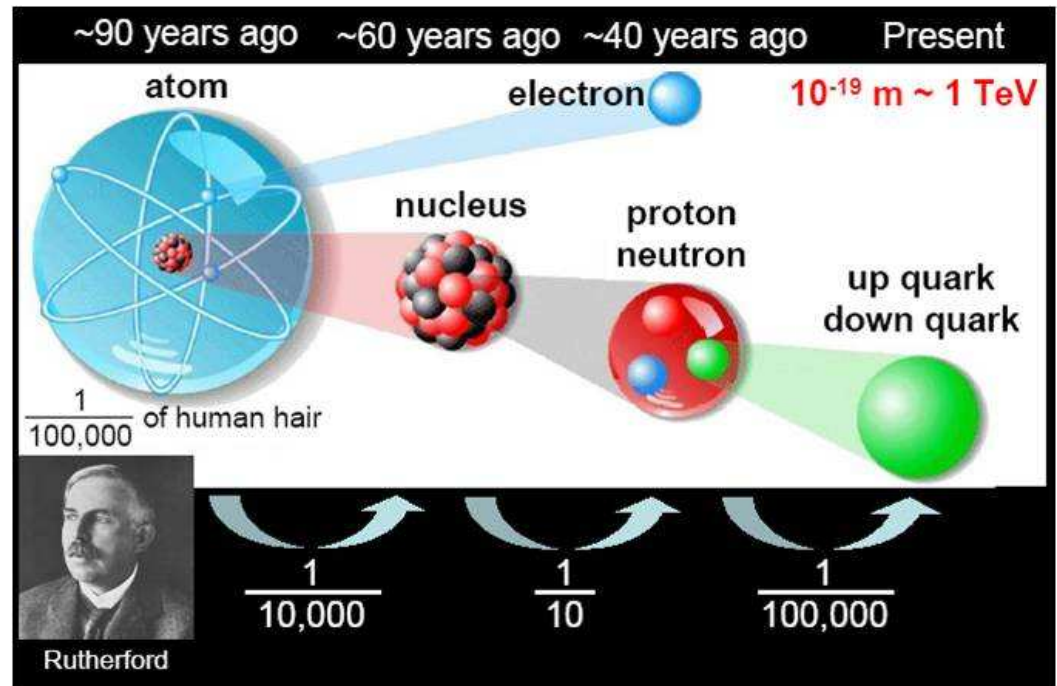

**Prof. Romulus Godang**  
University of South Alabama

**Wednesday, March 14, 2012**  
Department of Physics

# What is the World Made of ?

- Scientists originally thought the nucleus was a fundamental particle **but**
  - nucleus is made of protons and neutrons
  - protons and neutrons are made of quarks

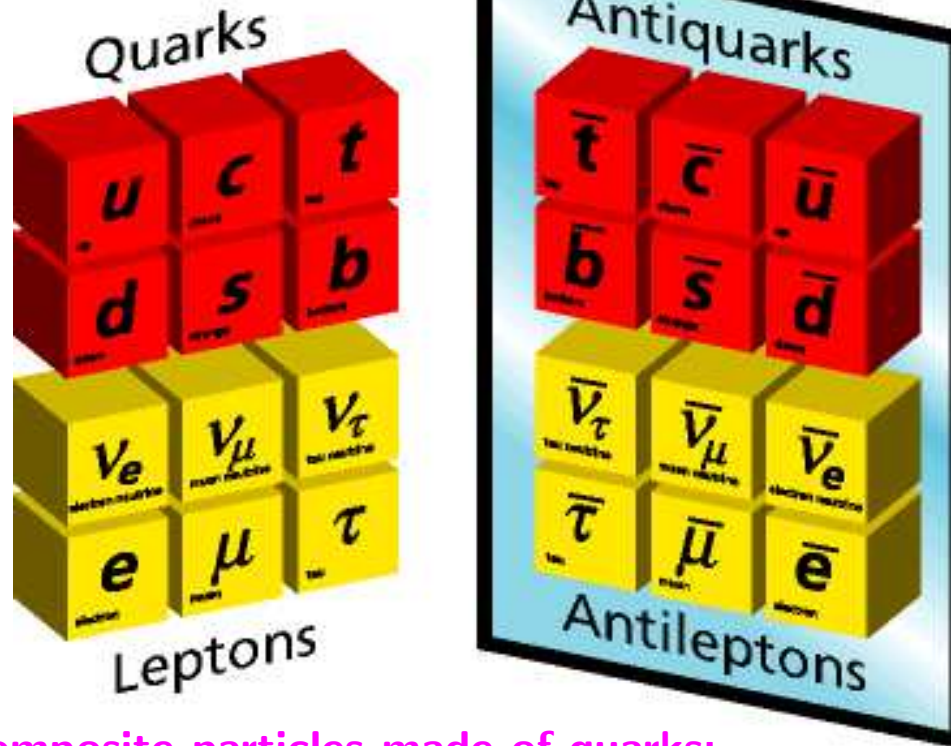

# Standard Model

- All the known matter particles are composites of 6 quarks and 6 leptons and they interact by exchanging force carrier particles:
  - ↳ Electromagnetic ( $\gamma$ ), Weak ( $Z^0$ ,  $W^\pm$ ), and Strong (gluons)
  - ↳ Gravity (Graviton is not in SM)

# Standard Model

- Hadrons are composite particles made of quarks:
  - Baryons are any hadron which is made of three quarks ( $qqq$ )
    - ↪ proton ( $uud$ ) and antiproton ( $\bar{u}\bar{u}\bar{d}$ )
  - Mesons contain one quark ( $q$ ) and one antiquark ( $\bar{q}$ )
    - ↪  $B^0$  ( $d\bar{b}$ ) and  $\bar{B}^0$  ( $\bar{d}b$ )

# The Birth of the Universe (13.7 Billion Years Ago)

## A Brief History of Time

- **$10^{-43}$  -  $10^{-37}$  secs**
  - Gravity and Strong forces separate out
- **$10^{-35}$  secs**
  - Inflation
- **$10^{-10}$  seconds**
  - Quark-AntiQuark Annihilation (**CP Violation**)
- **10 microseconds**
  - Quarks form protons, neutrons
- **380,000 years (last scatter)**
  - Nuclei capture electrons to form atoms; **universe transparent to light**
- **1.0 Gy Galaxies; 6 Gy: Dark Energy Dominates ... ..**
- **13.7 Gigayears: Today**

- After the Big Bang exploded with enormous energy, the universe began to cool-down that has lasted until our own time
- CP Violation process occurred  $10^{-10}$  seconds after the explosion.

# What Was Happened to the Antimatter

# What Was Happened to the Antimatter ?

How do we know there is almost no antimatter around ?

- **When a matter and antimatter meet, they annihilate into pure energy**

→ leaving only photons and neutrinos

- **The fact: we don't see this kind of energy in our daily life**

**Can we see the evidence of antimatter ?**

**The magnetic field makes negative particles curl left, positive particles curl right**

# Why is the Universe Exclusively Made of Matter ?

## □ Andrei Sakharov (JETP, 5, No 1, 1967)

1. Baryon violating interactions
2. Thermal non-equilibrium situation
3. CP Violation

Nobel Peace Prize in 1975 →

## □ Testing the Sakharov's criteria:

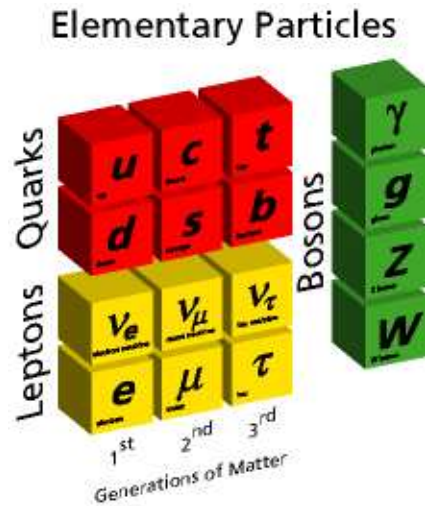

1. No evidence that baryon number is violated
2. In thermal equilibrium particles are identical → No asymmetry

**CP violation is necessary to understand matter-antimatter imbalance**

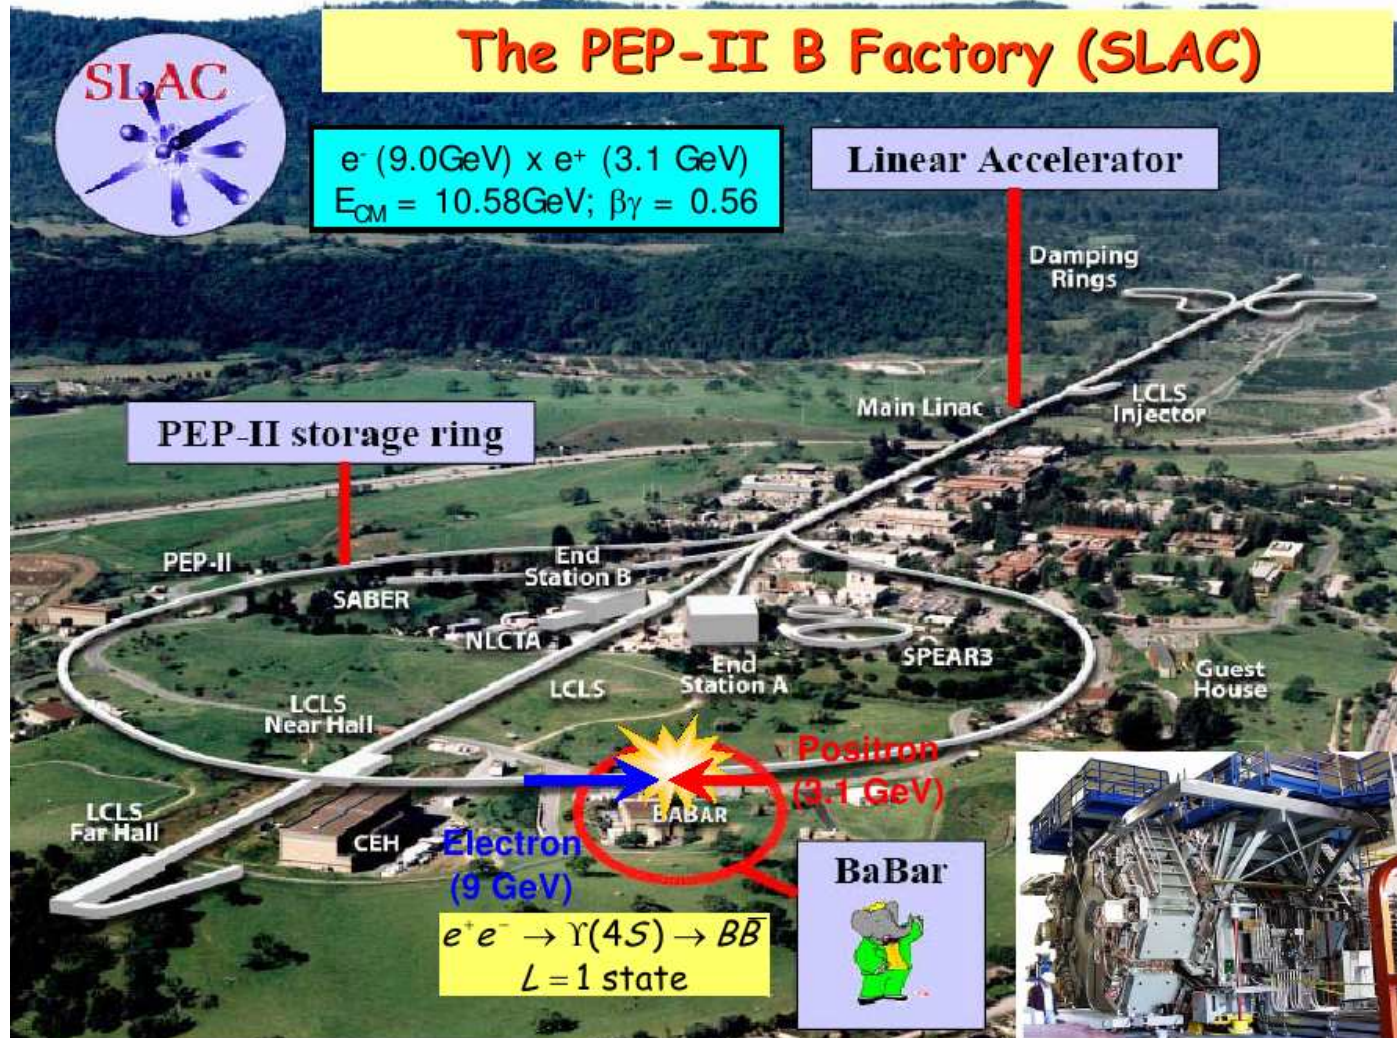

# CP Violation in B Mesons

- In 1962: Nicola Cabibbo introduced 2 generation quarks
- In 1972: Kobayashi and Maskawa introduced 3 generation quarks with CP violation in  $B$  Meson → A Brilliant Idea
- All Fundamental Particles in Standard Model  
(12 + 36 + 12 + Higgs) = 61 particles (excluding Graviton)

# BABAR Experiment in USA

- BABAR at Stanford Linear Accelerator Center (SLAC), California

- Sister B-factory machine is at KEKB (Tsukuba) in Japan

## BELLE Experiment in Japan

Another B Factory at KEKB

# CP Violation in $B$ Meson

- BABAR and Belle directly measured CP violation in  $B$  system

**BABAR** :  $e^+$  (3.1 GeV) -  $e^-$  (9 GeV)

**Belle** :  $e^+$  (3.5 GeV) -  $e^-$  (8 GeV)

In 1999 BABAR and Belle had first colliding beam

In 2001 BABAR and Belle reported the first measurement of direct

**CP violation in  $B$  meson**  $\leftrightarrow$  **fundamental matter-antimatter asymmetry**

The poster features a 3D cutaway illustration of the KECB B-Factory accelerator complex, showing the two main rings and various beamlines. The text is in a mix of English and Japanese, highlighting the facility's status as the world's strongest accelerator and its accessibility for public viewing. The KECB logo is in the top right, and the entrance to the B-Factory tunnel is indicated at the bottom right.

**40-Fold Luminosity than KEKB**

# CP Violation in B Meson

**BABAR : (3.1 GeV)  $e^+$   $\Rightarrow$   $\Leftarrow$   $e^-$  (9 GeV)**

→ In 2001 BABAR and Belle discovered direct CP violation in  $B$  mesons

↪ A source of matter-anti-matter asymmetry

→ YET a lot more physics to come...

# CP Violation Discovery

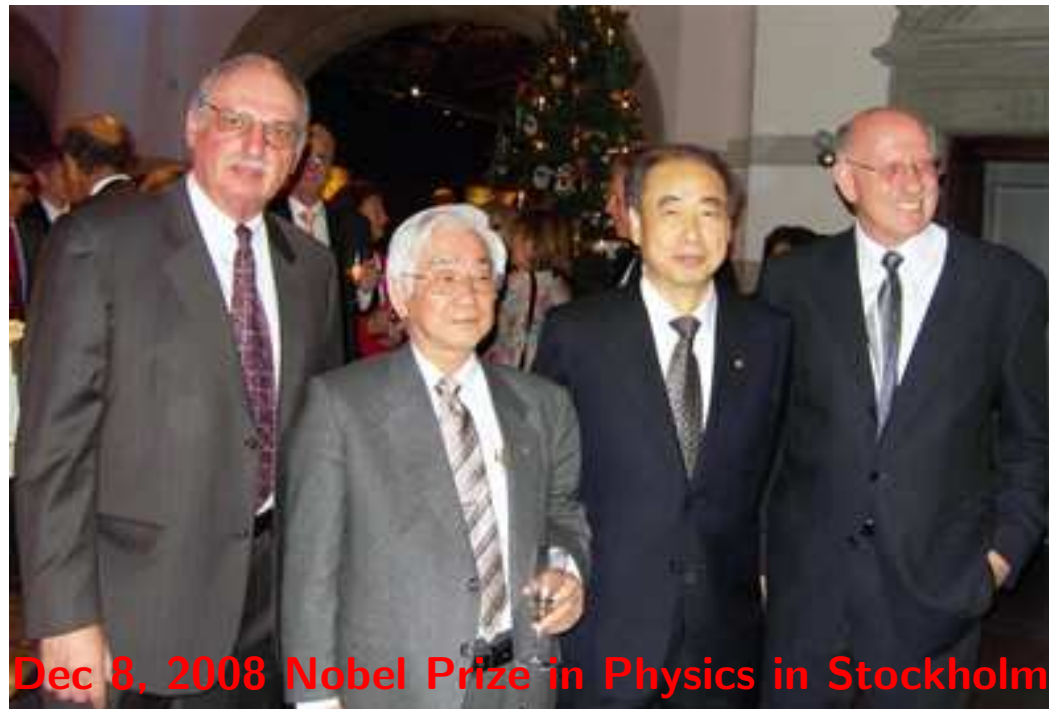

- CP violation was discovered by BABAR and Belle in 2001

- This plot shows CP violation (3.2% asymmetry precision)

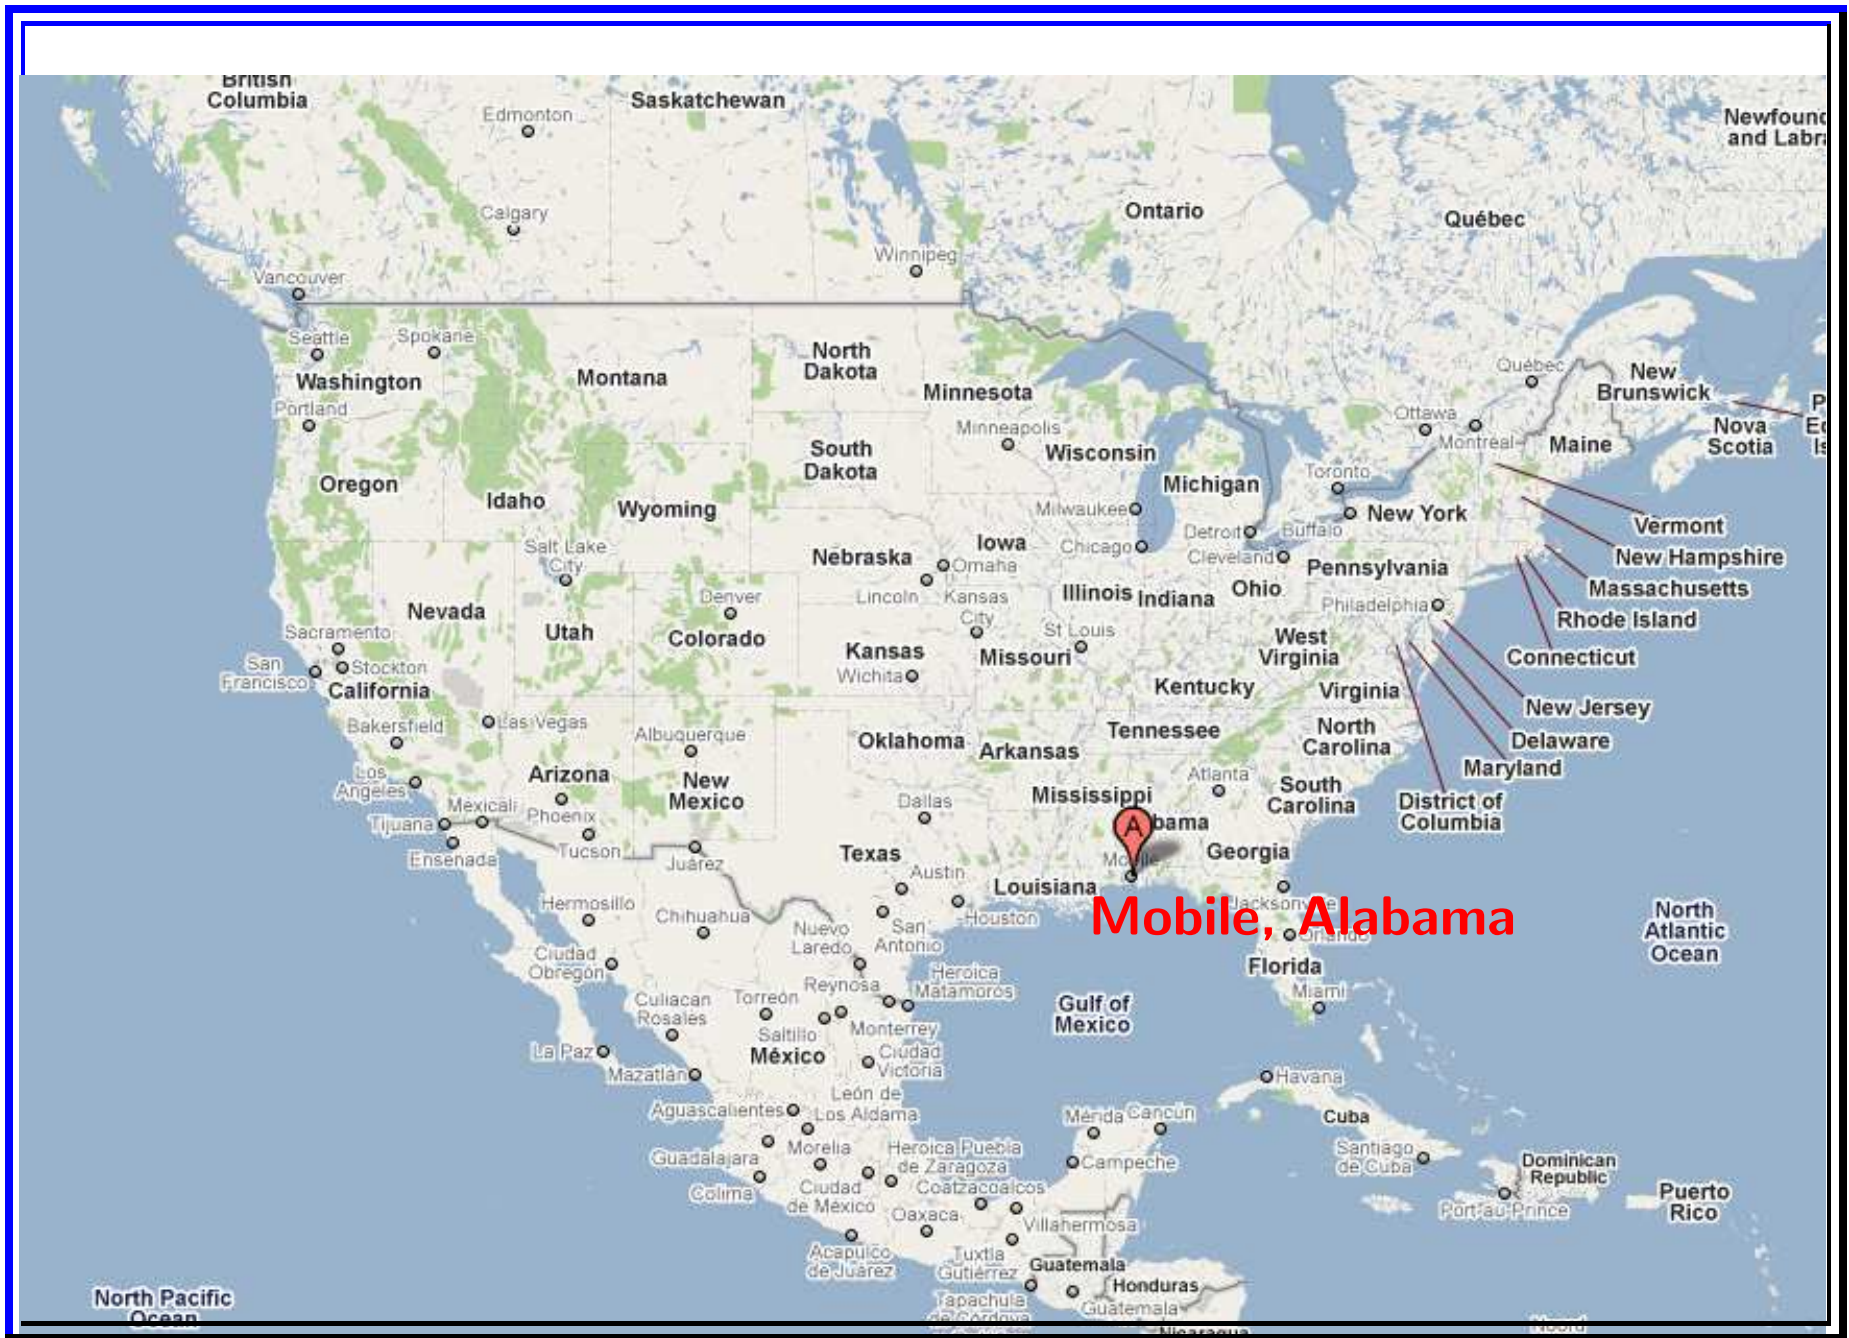

Matter and anti-matter is behaving differently (CP violation)

# Search for New Physics

# Search for Higgs Bosons

## How the elementary particles get their mass ?

- Spontaneous symmetry-breaking: **the Higgs** generates mass by **self-interaction**

★ It implies the existence new particle so called “Higgs boson”

- Higgs particle is named after Peter Higgs

- Leon Lederman (Nobel 1988) called it “**God Particle**”

- **Challenge:** The Higgs mass is a free parameter in the SM

↪ What is the Higgs mass?

- LEP ( $e^+ - e^-$ ) at CERN (2002) searched for the SM Higgs

↪ Yield a lower limit:  $M_H > 114.4 \text{ GeV}$  (C.L. only)

# Search for SM Higgs (CP-Even Scalar)

□ November, 2009 : Update from CDF and D0 arXiv:0911.3930

Excluded  $163 < M_H < 166 \text{ GeV}/c^2$  (95% C.L. Limit)

# Search for SM Higgs at Tevatron

- February, 2012 : CDF measured the mass of  $W$

$$M_W = 80.347 \pm 0.019 \text{ GeV}/c^2 \text{ (a precision of 0.02\%)}$$

- CDF and LHC results:

$$\text{Allowed } 115 < M_H < 127 \text{ GeV}/c^2$$

□ **Next-to-Minimal Supersymmetric Standard Model (NMSSM)**

→ **Light CP-Odd Pseudoscalar:**

$$A^0 \equiv a_1^0 \equiv a_1 = \cos \theta_A a_{MSSM} + \sin \theta a_S$$

□ **For  $m_{a_1} < 2m_b$ , the lightest CP-even Higgs ( $h^0$ )**

$h^0 \rightarrow a_1 a_1$  can avoid LEP limits

**F = Electroweak Symmetry  
Breaking (EWSB) fine tuning**

$\tan \beta$  = ratio of the vacuum  
expectation values

$$m_{a_1} < 2m_\tau$$

$$2m_\tau < m_{a_1} < 7.5 \text{ GeV}$$

$$7.5 \text{ GeV} < m_{a_1} < 8.8 \text{ GeV}$$

$$8.8 \text{ GeV} < m_{a_1} < 9.2 \text{ GeV}$$

# Prediction Higgs $A^0$ : PRD 81, 075003 (2010): Dermisek, Gunion

- At tree-level,  $\mathcal{B}(a)$  apply equally to  $\mathcal{B}(A^0)$

independent of  $\cos \theta_A$  due to the absence of tree-level  $a$

- $\mathcal{B}(a \rightarrow \tau^+\tau^-)$  and  $\mathcal{B}(a \rightarrow \mu^+\mu^-)$  as a function of  $\tan \beta$

$\tan \beta = h_u/h_d =$  ratio of the vacuum expectation value

- At  $\tan \beta > 2$ ,  $\mathcal{B}(a \rightarrow \tau^+\tau^-)$  and  $\mathcal{B}(a \rightarrow \mu^+\mu^-)$

change very little with increasing  $\tan \beta$  at any given  $m_a$

# BABAR Data: $\Upsilon(nS)$

## Final BABAR Data

- BaBar data sets:
  - 122 x 10<sup>6</sup>  $\Upsilon(3S)$  decays
  - 99 x 10<sup>6</sup>  $\Upsilon(2S)$  decays
  - “offpeak” samples of 1.4fb<sup>-1</sup> and 2.4fb<sup>-1</sup> collected ~30 MeV below the  $\Upsilon(2S)$  and  $\Upsilon(3S)$
  - 79 fb<sup>-1</sup> “continuum background” samples of  $\Upsilon(4S)$  with similar detector conditions

- Trigger requirements modified for narrow  $\Upsilon$  data taking

# $\Upsilon(3S) \rightarrow \gamma A^0, A^0 \rightarrow \tau^+ \tau^-$ BABAR

◇ Search for  $\Upsilon(3S) \rightarrow \gamma A^0, A^0 \rightarrow \tau^+ \tau^-$ , PRL 103, 181801 (2009)

□ The photon energy in the Center-of-Mass (CM) is given by

$$E_\gamma^* = \frac{m_\Upsilon^2 - m_{A^0}^2}{2m_\Upsilon}$$

□  $E_\gamma > 100$  MeV, and exactly two charged tracks

□ Both charged tracks are identified as leptons ( $e$  or  $\mu$ )

□ Backgrounds

- $e^+e^- \rightarrow \gamma\tau^+\tau^-$  (mostly)

- QED process including two photons i.e:

- ▷  $e^+e^- \rightarrow e^+e^-e^+e^-$

- ▷  $e^+e^- \rightarrow e^+e^-\mu^+\mu^-$

- $e^+e^- \rightarrow q\bar{q}$  ( $q = u, d, s, c$ )  $\rightarrow$  small

# $\Upsilon(3S) \rightarrow \gamma A^0, A^0 \rightarrow \tau^+ \tau^-$ PRL 103, 181801 (2009) BABAR

□ The residual background is exploited by 8 kinematic and angular variables

□ Peaking contributions

- $\Upsilon(3S) \rightarrow \gamma \chi_{bJ}(2P)(J = 0, 1, 2)$

- $\hookrightarrow \chi_{bJ}(2P) \rightarrow \gamma \Upsilon(nS)(n = 1, 2)$

- $\hookrightarrow \Upsilon(nS) \rightarrow \tau^+ \tau^-$

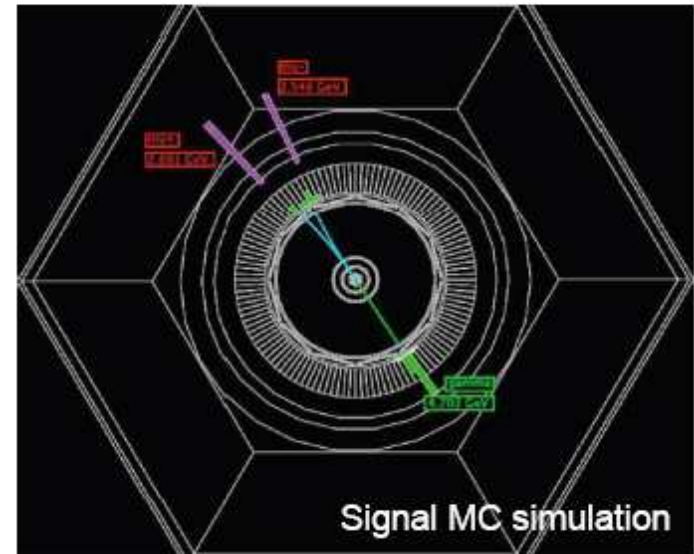

□ Search  $A^0$  in  $E_\gamma$  spectrum at  $4.03 < m_{A^0} < 10.10 \text{ GeV}/c^2$

**$\mathcal{B}(\Upsilon(3S) \rightarrow \gamma A^0) \times \mathcal{B}(A^0 \rightarrow \tau^+ \tau^-) < (1.5 - 16) \times 10^{-5}$  90% C.L.**

**$\mathcal{B}(\eta_b \rightarrow \tau^+ \tau^-) < 9\%$  at 90% C.L.**

# $\Upsilon(2S, 3S) \rightarrow \gamma A^0, A^0 \rightarrow \mu^+ \mu^-$ BABAR

- Search for  $A^0$  scalar boson in the radiative decays of  $\Upsilon(2S)$  and  $\Upsilon(3S)$
- If  $A^0$  exists its decays depends on its mass
- Assuming no invisible (neutralino) decays  
 $\mathcal{B}(A^0 \rightarrow \mu^+ \mu^-) \approx$  sizable at low  $m_{A^0} < 2m_\tau$
- Require 2 oppositely charged tracks and one  $\gamma$  at least one of which is identified as a muon
- $E_\gamma > 200$  MeV (COM), while allowing additional  $\gamma$  with energy lower than 200 MeV
- Use kinematic fit of  $\gamma\mu^+\mu^-$  system, including the beam energy and decay vertex constraints

# $\Upsilon(2S, 3S) \rightarrow \gamma A^0, A^0 \rightarrow \mu^+ \mu^-, \text{ PRL } 103, 081803 \text{ (2009) BABAR}$

- Search for  $A^0$  as a function of mass  $m_{A^0}$

Scan range  $0.212 < m_{A^0} < 9.3 \text{ GeV}$

(a)  $\mathcal{B}(\Upsilon(2S) \rightarrow \gamma A^0) \times \mathcal{B}_{\mu\mu}$

(b)  $\mathcal{B}(\Upsilon(3S) \rightarrow \gamma A^0) \times \mathcal{B}_{\mu\mu}$

(c)  $f_Y^2 \times \mathcal{B}_{\mu\mu}$

$\mathcal{B}(\Upsilon(nS) \rightarrow \gamma A^0)$  are related to the effective

Yukawa coupling  $f_Y$  of bound  $b$  quark to  $A^0$

$$\frac{\mathcal{B}(\Upsilon(nS) \rightarrow \gamma A^0)}{\mathcal{B}(\Upsilon(nS) \rightarrow \ell^+ \ell^-)} = \frac{f_Y^2}{2\pi\alpha} \left(1 - \frac{m_{A^0}^2}{m_{\Upsilon(nS)}^2}\right)$$

- Shaded area is excluded from the search around the  $J/\psi$  and  $\psi(2S)$  resonances
- No signal observed at  $m_{A^0} \sim 214 \text{ MeV}$

Significant positive fluctuation of  $\Upsilon(3S) \sim 2.8\sigma$  and  $\Upsilon(2S) \sim 3.1\sigma$

$$\mathcal{B}(\eta_b \rightarrow \mu^+ \mu^-) < 0.9\% \text{ at } 90\% \text{ C.L.}$$

# CKM Matrix

- In SM, quark can change flavor by weak interactions:

$$\begin{pmatrix} d' \\ s' \\ b' \end{pmatrix} = \begin{pmatrix} V_{ud} & V_{us} & V_{ub} \\ V_{cd} & V_{cs} & V_{cb} \\ V_{td} & V_{ts} & V_{tb} \end{pmatrix} \begin{pmatrix} d \\ s \\ b \end{pmatrix}$$

Cabibbo-Kobayashi-Maskawa (CKM) matrix

$$[\text{Weak eigenstates}] = [V_{CKM}] [\text{quark mass eigenstates}]$$

The CKM matrix contains complex numbers

- Wolfenstein's CKM matrix form:

$$V_{CKM} = \begin{pmatrix} 1 - \frac{1}{2}\lambda^2 & \lambda & A\lambda^3(\rho - i\eta) \\ -\lambda & 1 - \frac{1}{2}\lambda^2 & A\lambda^2 \\ A\lambda^3(1 - \rho - i\eta) & -A\lambda^2 & 1 \end{pmatrix}$$

- $\lambda \sim 0.22$  (expansion parameter)
- $A$ ,  $\rho$ , and  $\eta$  can be measured in  $B$  decays

# Unitarity Triangle (UT)

- By applying the Unitarity condition (scalar product of any two rows or columns):

$$V_{ub}^* V_{ud} + V_{cb}^* V_{cd} + V_{tb}^* V_{td} = 0$$

- CKM matrix can be presented in the complex plane → Unitarity Triangle (UT)

- It is very important to measure the CKM angles and its sides!
- We need to measure them precisely in order to search for New Physics

→ Deviation from the Standard Model will signal New Physics!

# Status of UT Triangle

**Constraints in the  $\bar{\rho} - \bar{\eta}$  plane**

**Zoomed constraints in the  $\bar{\rho} - \bar{\eta}$  plane**

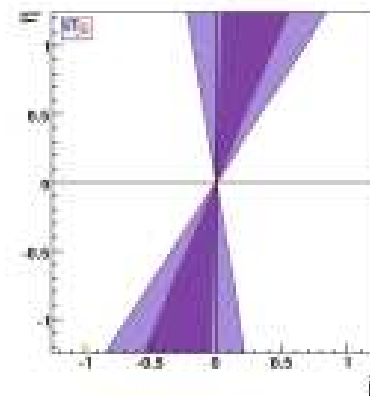

Precision  $\beta \approx 1^\circ$

Precision  $\alpha \approx 4^\circ$

Precision  $\gamma \approx 14^\circ$

# Measuring Angle $\gamma$

- Interference between  $b \rightarrow c\bar{u}s$  and  $b \rightarrow u\bar{c}s$  tree amplitudes

$b \rightarrow c\bar{u}s$  transition:  $B^+ \rightarrow D^0 K^+$

$b \rightarrow u\bar{c}s$  transition:  $B^+ \rightarrow \bar{D}^0 K^+$

- **GLW:** Cabibbo-suppressed  $D \rightarrow$  CP-eigenstates ( $K^+ K^-, \pi^+ \pi^-$ )

Gronau, London, Wyler: PLB 253, 1991 & PLB 265, 1991

- **ADS:**  $D \rightarrow$  Cabibbo-favored and doubly-Cabibbo-suppressed ( $K^\pm \pi^\mp$ )

Atwood, Dunietz, Soni: PRL 78, 3257, 1997

- **GGSZ:** Cabibbo-favored  $D \rightarrow$  self-conjugate ( $K_s^0 \pi^+ \pi^-, K_s^0 K^+ K^-$ )

Giri, Grossman, Soffer, Zupan: PRD 68 054018, 2003  $\rightarrow$  time limited

# GLW on $B^\pm \rightarrow DK^\pm$ PLB 253, 1991 & PLB 265, 1991

□ In GLW method the  $D^0$  mesons are reconstructed:

- $CP+$  :  $D^0 \rightarrow K^+K^-, \pi^+\pi^- \rightarrow D_{CP\pm} = \text{CP eigenstates of } D \text{ system}$
- $CP-$  :  $D^0 \rightarrow K_s^0\pi^0, K_s^0\omega, K_s^0\phi$

□ Two direct CP-violating partial decay rate asymmetries:

$$A_{CP\pm} \equiv \frac{\Gamma(B^- \rightarrow D_{CP\pm}K^-) - \Gamma(B^+ \rightarrow D_{CP\pm}K^+)}{\Gamma(B^- \rightarrow D_{CP\pm}K^-) + \Gamma(B^+ \rightarrow D_{CP\pm}K^+)} \rightarrow \Gamma = \text{partial decay width}$$

□ Two ratios of charged averaged partial rates:

$$R_{CP\pm} \equiv 2 \frac{\Gamma(B^- \rightarrow D_{CP\pm}K^-) + \Gamma(B^+ \rightarrow D_{CP\pm}K^+)}{\Gamma(B^- \rightarrow D^0K^-) + \Gamma(B^+ \rightarrow \bar{D}^0K^+)}$$

□ Then  $\gamma$  can be extracted from the other two unknowns variables  $\delta_B$  and  $r_B$ :

$$R_{CP\pm} = 1 + r_B^2 \pm 2r_B \cos\delta_B \cos\gamma \quad A_{CP\pm} = \frac{\pm 2r_B \sin\delta_B \sin\gamma}{1 + r_B^2 \pm 2r_B \cos\delta_B \cos\gamma}$$

□  $\delta_B$  = the difference of their strong phases

□  $r_B$  = the magnitude of the ratio of the amplitudes for each decay

$$r_B \equiv \frac{|A(B^- \rightarrow \bar{D}^0 K^-)|}{|A(B^- \rightarrow D^0 K^-)|}$$

□ ML fit to  $\Delta E$ ,  $m_{ES}$ , and Fisher (event shape variable)

**CP+ :  $\Delta E$**

**CP+ :  $m_{ES}$**

**CP- :  $\Delta E$**

**CP- :  $m_{ES}$**

□ **GLW: Cabibbo-suppressed  $D \rightarrow$  CP-eigenstates ( $K^+K^-$ ,  $\pi^+\pi^-$ )**

Gronau, London, Wyler: PLB 253, 1991 & PLB 265, 1991

□ Blue line: full PDF, Green:  $B \rightarrow D\pi$ , Purple: remaining backgrounds

□  $B \rightarrow DK$  contribution: the region between blue and green

- Using BABAR Data:  $425 \text{ fb}^{-1}$  (467 M  $B\bar{B}$ )

$$A_{CP+} = 0.25 \pm 0.06 \pm 0.02 \quad A_{CP-} = -0.09 \pm 0.07 \pm 0.02$$

$$R_{CP+} = 1.18 \pm 0.09 \pm 0.05 \quad R_{CP-} = 1.07 \pm 0.08 \pm 0.04$$

- Direct CP-Violation on  $B^{\pm} \rightarrow DK^{\pm}$ :  $A_{CP+}$  at  $3.6\sigma$  from zero

- At 68% CL: angle  $\gamma$  mod  $180^\circ$  belongs to one of the three intervals:

$$(11.3, 22.7^\circ), (80.8, 99.2^\circ), (157, 168.7^\circ)$$

- At 68% CL:  $0.24 < r_B < 0.45$

## ADS on $B^\pm \rightarrow DK^\pm$ Theory: PRL 78, 3257, 1997

□ In ADS method (D. Atwood, I Dunietz, A Soni)

- $B^+ \rightarrow \bar{D}^0 K^+ \rightarrow \bar{D}^0 \rightarrow K^- \pi^+$  [doubly-Cabbibo-suppressed]

(interferes with  $\Leftrightarrow$ )

- $B^+ \rightarrow D^0 K^+ \rightarrow D^0 \rightarrow K^- \pi^+$  [Cabbibo-favored]

$\Rightarrow$  Opposite-sign (OS) because two kaons have opposite charges

□ Define same-sign (SS) events:

- $B^+ \rightarrow \bar{D}^0 K^+ \rightarrow \bar{D}^0 \rightarrow K^+ \pi^-$  [Cabbibo-favored]

□ BABAR published 2 results where  $D^0$  are reconstructed:

- $D^0 \rightarrow K^+ \pi^-$ ; Data:  $467 \times 10^6 B\bar{B} \rightarrow$  PRD 82 072006, 2010

- $D^0 \rightarrow K^+ \pi^- \pi^0$ ; Data:  $474 \times 10^6 B\bar{B} \rightarrow$  PRD 84 012002, 2011

## ADS on $B^\pm \rightarrow DK^\pm$ Continue...

### □ Extract new set of variables:

- $R^+ = \frac{\Gamma(B^+ \rightarrow [K^- \pi^+] K^+)}{\Gamma(B^+ \rightarrow [K^+ \pi^-] K^+)} \equiv \frac{\text{opposite sign yield}}{\text{same sign yield}}$  from  $B^+$
- $R^- = \frac{\Gamma(B^- \rightarrow [K^+ \pi^-] K^-)}{\Gamma(B^- \rightarrow [K^- \pi^+] K^-)} \equiv \frac{\text{opposite sign yield}}{\text{same sign yield}}$  from  $B^-$

### □ Neglecting D-mixing effects the ratios $R^+$ and $R^-$ can be written as

$$R^+ = r_B^2 + r_D^2 + 2r_B r_D k_D \cos(\gamma + \delta_B + \delta_D)$$

$$R^- = r_B^2 + r_D^2 + 2r_B r_D k_D \cos(\gamma - \delta_B + \delta_D)$$

### □ where

- $r_B \equiv \frac{|A(B^+ \rightarrow D^0 K^+)|}{|A(B^+ \rightarrow D^0 K^+)|} = 0.106 \pm 0.016$      $r_D^2 = \frac{\Gamma(D^0 \rightarrow K^+ \pi^-)}{\Gamma(D^0 \rightarrow K^- \pi^+)} = (2.2 \pm 0.1) \times 10^{-3}$
- $\delta_B$  and  $\delta_D = (47_{-17}^{+14})^\circ$  are CP conserving strong phase
- $\gamma$  is CP violating weak phase
- $k_D$  is the coherence factor between 0 to 1:  $k_D = 0.84 \pm 0.07$
- $k_D$  and  $\delta_D$  were measured from CLEOc

- Simultaneous fit to  $m_{ES}$  and NN (event shape and tagging variables)

$m_{ES}$ : opposite-sign  $B^+ \rightarrow D^0 K^+$

NN: opposite-sign  $B^+ \rightarrow D^0 K^+$

- Solid-blue: Full PDF, Red: sum of all bkg, Dotted-blue:  $q\bar{q}$  background
- ADS  $B^\pm \rightarrow DK^\pm$  results:

$$R^+ = (2.2 \pm 0.9 \pm 0.3) \times 10^{-2} \quad R^- = (0.2 \pm 0.6 \pm 0.2) \times 10^{-2}$$

# ADS BABAR Results Continue...

- This measurement allowed us to extract variables:  $r_B$  and  $\gamma$

Constraints on  $r_B^{(*)}$ :  $B^- \rightarrow D^{(*)} K^-$

C.L. curve as a function of  $\gamma$

- For  $\gamma$  result: combining  $B \rightarrow DK$  and  $D^* K$

- The variables  $r_B^{(*)}$  can be extracted:

$$r_B = (9.5^{+5.1}_{-4.1})\% \quad r_B^* = (9.6^{+3.5}_{-5.1})\%$$

# ADS Results on $D^0 \rightarrow K^+\pi^-\pi^0$ PRD 84 012002, 2011 (NEW)

□ Simultaneous fit to  $m_{ES}$  and Fisher: OS  $\approx 20$  events; SS  $\approx 2000$  events

$m_{ES}$ : opposite-sign with  $F > 0.5$

$m_{ES}$ : same-sign with  $F > 0.5$

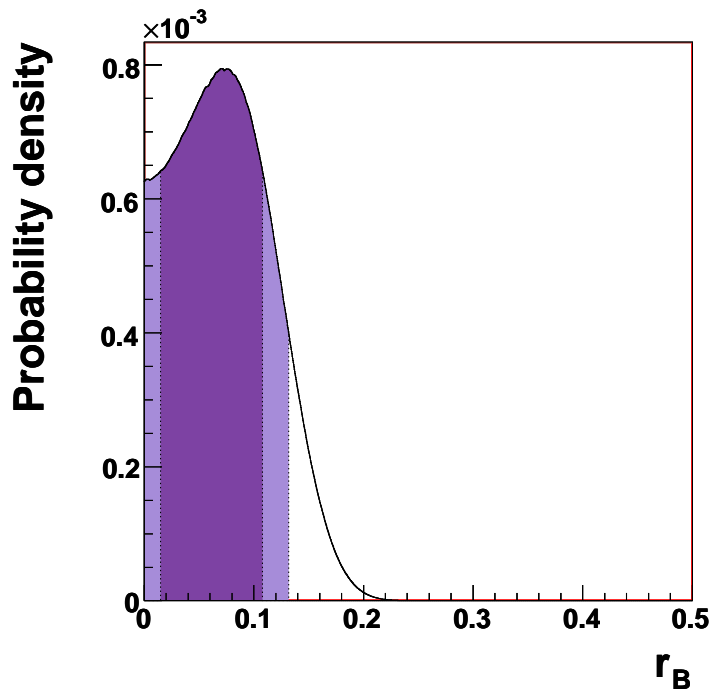

Fisher: OS  $m_{ES} > 2.27$   $\text{GeV}/c^2$

Fisher: SS  $m_{ES} > 2.27$   $\text{GeV}/c^2$

# ADS Results on $D^0 \rightarrow K^+\pi^-\pi^0$ PRD 84 012002, 2011 (NEW)

## □ ADS results on $r_B$ :

Bayesian probability density function for  $r_B$

Dark:  $0.01 < r_B < 0.11$  at 68% probability

Light:  $r_B < 0.13$  at 90% probability

→ Subject to small  $r_B$ , this measurement

has less precision for  $\gamma$  result

## □ New results on $R^+$ and $R^-$ (statistical limited):

$$R^+ = (5_{-10}^{+12+1}) \times 10^{-3} \quad R^- = (12_{-10}^{+12+2}) \times 10^{-3}$$

## □ At 90% probability limit:

$$R^+ < 23 \times 10^{-3} \quad R^- < 29 \times 10^{-3}$$

# Current Understanding of Our Universe

**SUMMARY: Where Are We Now?**

★ A lot of things need to be discovered

# We Are Not Alone

You Could Be Part of The Physics Exploration!

THANK YOU!
